

# Snek - WriteUp

1. Reading and inferring the challenge description.

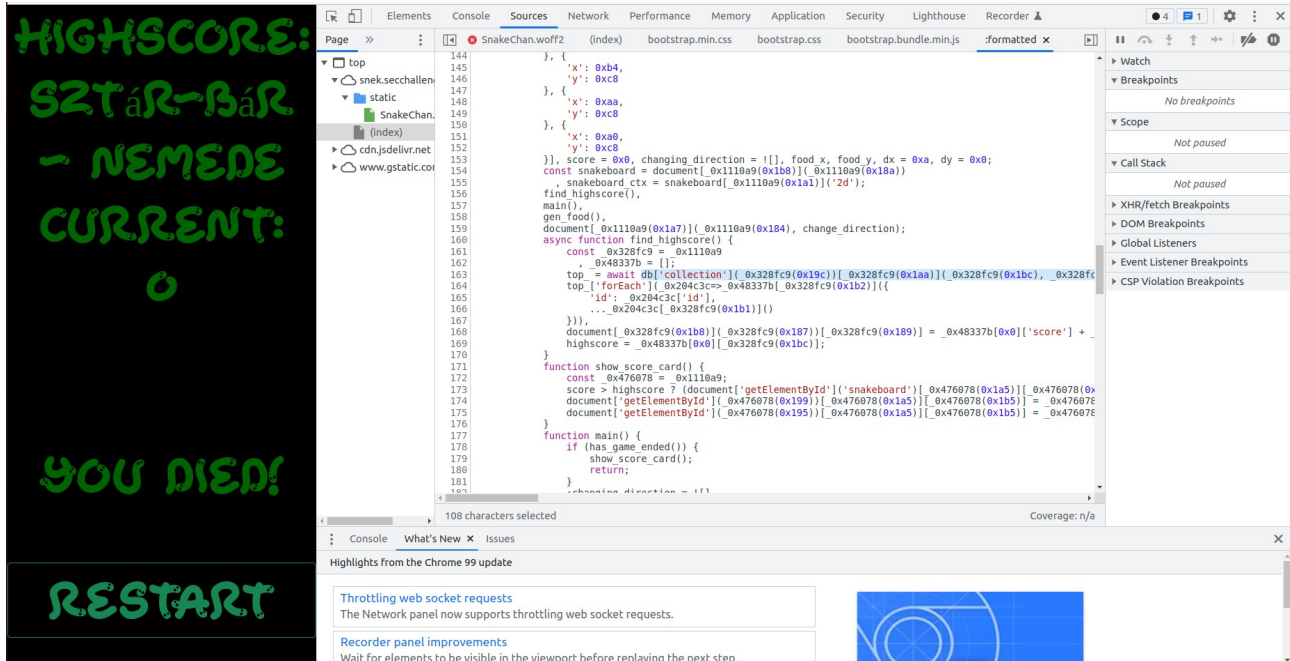

2. Trying to understand where to start.

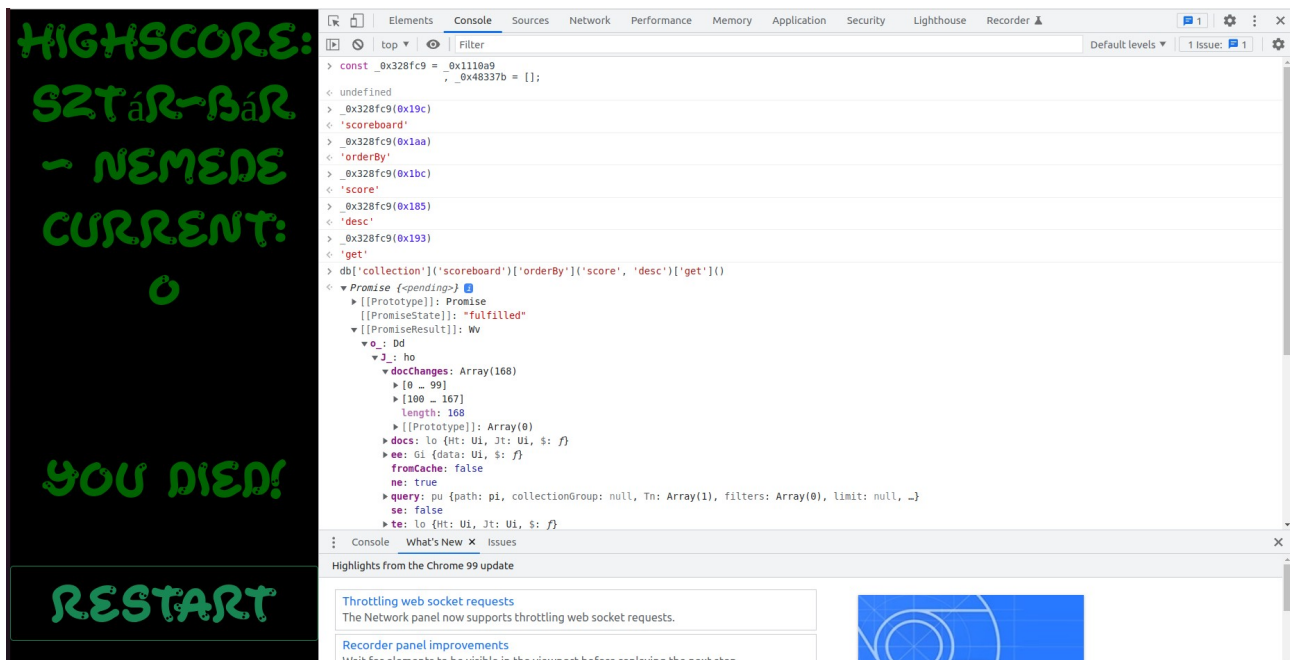

3. Open the source code in a human-readable format (pretty-print), and try to understand what is going on.

After a while we can see that the flag is not hidden in the source code so we think that it is probably hidden in the firebase, next we take a look at the connection with the Firestore database.

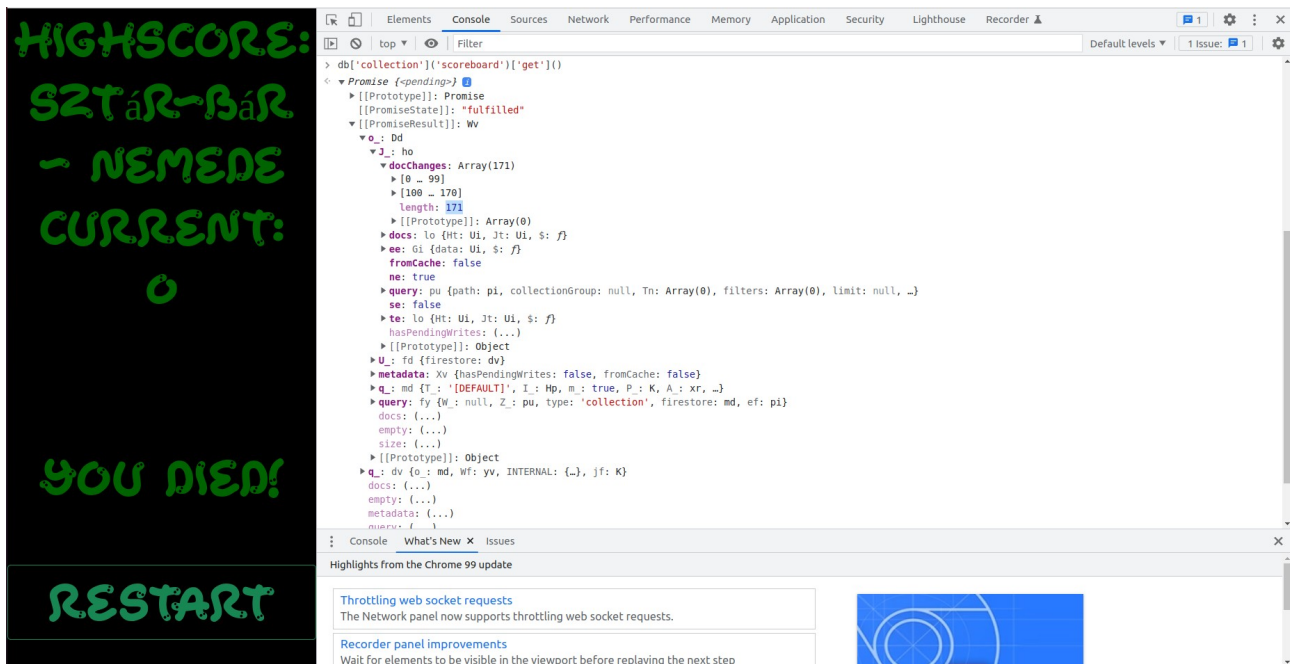

4. playing with the Firestore database to understand what is going on.

(Running this line: `db['collection'](_0x328fc9(0x19c))[_0x328fc9(0x1aa)](_0x328fc9(0x1bc), _0x328fc9(0x185))[_0x328fc9(0x193)]()`)

As we can see the query returned 168 documents.

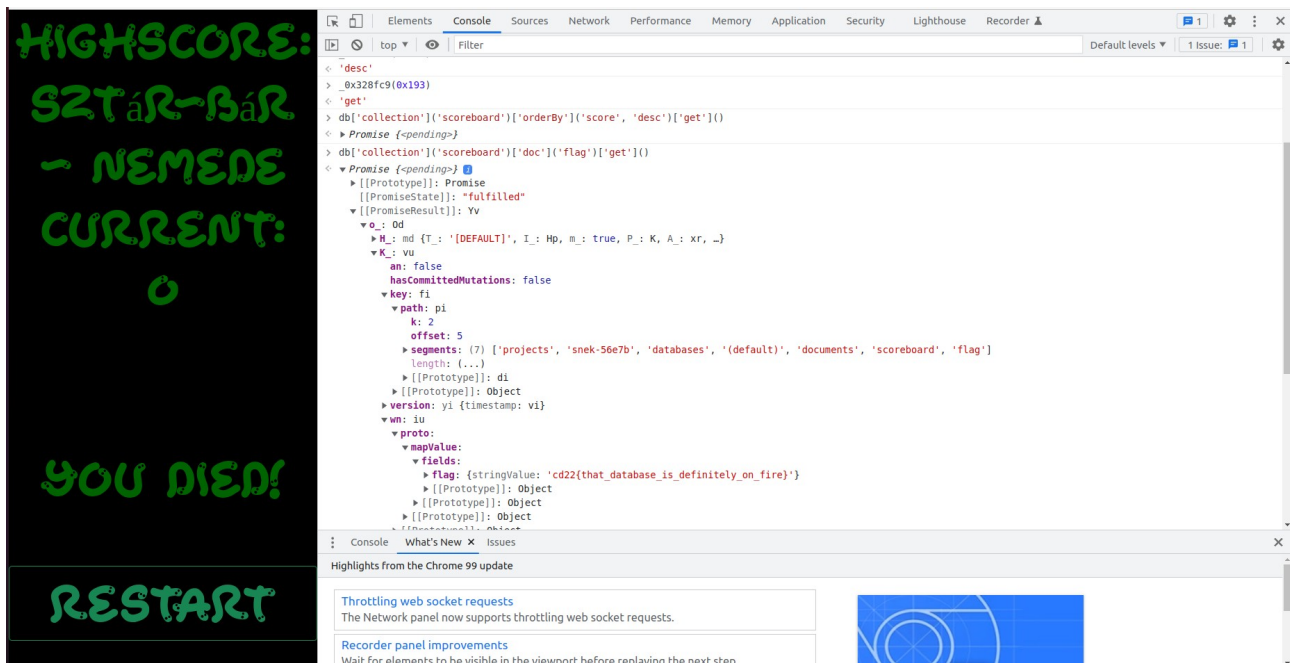

We continued playing with the Firestore database (removed the orderby function).

As we can see the query returned 171 documents.

This means that there are more documents that do not contain a score maybe a flag!

5. Trying to get the flag.

Using this query we were able to see the flag.
